Motivation

In the n -dimensional real Euclidean space \mathbb{R}^n , asymptotic cones and functions play a significant role to consider optimization problems. In addition, semidefinite programming (SDP) is one of the most important optimization problems because these problems have appeared in various area of mathematical sciences. The following content explains the relation between asymptotic cones and SDP.

Contents

- 6 Conclusion

Preliminary

\mathbb{R}^n : n -dimensional real Euclidean space.

\mathbb{S}^n : n -dimensional real symmetric matrix space.

The inner product of \mathbb{R}^n $\langle \cdot, \cdot \rangle$ is defined by

$$\langle x, y \rangle := \sum_{i=1}^n x_i y_i \text{ for } x = (x_1, \dots, x_n)^T \in \mathbb{R}^n \text{ and } y = (y_1, \dots, y_n)^T \in \mathbb{R}^n.$$

The norm is defined by $\|x\| := \langle x, x \rangle^{1/2}$. Like that, we can define the inner product and the norm of \mathbb{S}^n .

$$\langle X, Y \rangle := \text{tr}(XY) \text{ for } X, Y \in \mathbb{S}^n \quad \text{and} \quad \|X\| := \langle X, X \rangle^{1/2}$$

Preliminary

Definition 1

Let $f : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$.

- 1 The domain of f is defined by

$$\text{dom } f := \{x \in \mathbb{R}^n \mid f(x) < +\infty\}.$$

- 2 The epigraph of f is defined by

$$\text{epi } f := \{(x, y) \in \mathbb{R}^n \times \mathbb{R} \mid f(x) \leq y\}.$$

- 3 f is called proper if $\text{dom } f \neq \emptyset$.
- 4 f is called convex if $\text{epi } f$ is convex.
- 5 f is called lower semicontinuous (l.s.c.) if $\text{epi } f$ is closed.

Preliminary

Definition 2

Let $f : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$. The conjugate function of f is defined by

$$f^*(y) := \sup_{x \in \mathbb{R}^n} \{\langle x, y \rangle - f(x)\}.$$

Definition 3

Let $f : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$. f is said to be symmetric if

$$\forall x \in \mathbb{R}^n \text{ and } P : n \times n \text{ permutation matrix, } f(Px) = f(x).$$

Spectrally defined matrix functions

Definition 4

The function $\Phi : \mathbb{S}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ is said to be spectrally defined if there exists a symmetric function $f : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ such that

$$\Phi(X) = \Phi_f(X) := f(\lambda(X)), \forall X \in \mathbb{S}^n$$

where $\lambda(X) := (\lambda_1(X), \dots, \lambda_n(X))^T$ is the vector of eigenvalues of X in nondecreasing order.

Spectrally defined matrix functions

Definition 4

The function $\Phi : \mathbb{S}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ is said to be spectrally defined if there exists a symmetric function $f : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ such that

$$\Phi(X) = \Phi_f(X) := f(\lambda(X)), \forall X \in \mathbb{S}^n$$

where $\lambda(X) := (\lambda_1(X), \dots, \lambda_n(X))^T$ is the vector of eigenvalues of X in nondecreasing order.

Example

When we define a symmetric function f , a spectrally defined function is deduced:

$$f(\lambda) = \begin{cases} -\sum_{i=1}^n \log \lambda_i & \text{if } \lambda > 0; \\ +\infty & \text{otherwise} \end{cases}, \text{ and then } \Phi_f(X) = \begin{cases} -\log \det(X) & \text{if } X \succ 0; \\ +\infty & \text{otherwise.} \end{cases}$$

Spectrally defined matrix functions

Theorem 5 (A.S.Lewis (1996))

Suppose that the function $f : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ is symmetric, then

$$\Phi_f^* = \Phi_{f^*}$$

where $\Phi_f^*(Y) := \sup\{\langle X, Y \rangle - \Phi_f(X) \mid X \in \mathbb{S}^n\}, \forall Y \in \mathbb{S}^n$.

As a result of Theorem 5, the optimization problems $\min\{\Phi_f(X) \mid X \in \mathbb{S}^n\}$ and $\min\{f(x) \mid x \in \mathbb{R}^n\}$ are equivalent. In fact,

$$\begin{aligned} \inf_{X \in \mathbb{S}^n} \Phi_f(X) &= - \sup_{X \in \mathbb{S}^n} \{-\Phi_f(X)\} = - \sup_{X \in \mathbb{S}^n} \{\langle X, 0 \rangle - \Phi_f(X)\} \\ &= -\Phi_f^*(0) = -\Phi_{f^*}(0) = -f^*(0) = \inf_{x \in \mathbb{R}^n} f(x). \end{aligned}$$

Definition of Asymptotic Cones

Definition 6

$C \subset \mathbb{R}^n$, $C \neq \emptyset$. Then, the asymptotic cone of the set C , denoted by C_∞ , is the set below with $\{x_k\} \subset C$;

$$C_\infty = \left\{ d \in \mathbb{R}^n \mid \exists t_k \rightarrow +\infty, \exists x_k \in C \text{ with } \lim_{k \rightarrow \infty} \frac{x_k}{t_k} = d \right\}.$$

Example: $C = \{(x, y) \in \mathbb{R}^2 \mid y = x^2\}$. We let $x_k = (k, k^2)$ and $t_k = \|x_k\|$.

Definition of Asymptotic Cones

Definition 6

$C \subset \mathbb{R}^n$, $C \neq \emptyset$. Then, the asymptotic cone of the set C , denoted by C_∞ , is the set below with $\{x_k\} \subset C$;

$$C_\infty = \left\{ d \in \mathbb{R}^n \mid \exists t_k \rightarrow +\infty, \exists x_k \in C \text{ with } \lim_{k \rightarrow \infty} \frac{x_k}{t_k} = d \right\}.$$

Example: $C = \{(x, y) \in \mathbb{R}^2 \mid y = x^2\}$. We let $x_k = (k, k^2)$ and $t_k = \|x_k\|$.

Definition of Asymptotic Cones

Definition 6

$C \subset \mathbb{R}^n$, $C \neq \emptyset$. Then, the asymptotic cone of the set C , denoted by C_∞ , is the set below with $\{x_k\} \subset C$;

$$C_\infty = \left\{ d \in \mathbb{R}^n \mid \exists t_k \rightarrow +\infty, \exists x_k \in C \text{ with } \lim_{k \rightarrow \infty} \frac{x_k}{t_k} = d \right\}.$$

Example: $C = \{(x, y) \in \mathbb{R}^2 \mid y = x^2\}$. We let $x_k = (k, k^2)$ and $t_k = \|x_k\|$.

Properties around Asymptotic Cones

Proposition 7

Let C be a nonempty convex set in \mathbb{R}^n . Then the asymptotic cone C_∞ is a closed convex cone. Moreover, define the following sets;

$$D(x) := \{d \in \mathbb{R}^n \mid x + td \in \text{cl } C, \forall t > 0\} \forall x \in C,$$

$$E := \{d \in \mathbb{R}^n \mid \exists x \in C \text{ s.t. } x + td \in \text{cl } C, \forall t > 0\},$$

$$F := \{d \in \mathbb{R}^n \mid d + \text{cl } C \subset \text{cl } C\}.$$

Then $D(x)$ is in fact independent of x , which is thus now denoted by D , and $C_\infty = D = E = F$.

Remark

When C is a closed convex set, the asymptotic cone is also called the recession cone. In this presentation, we use the term the asymptotic cone.

Definition of Asymptotic Functions

Definition 8

Let $f : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ be proper. Then, there exists $f_\infty : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ satisfying $\text{epi } f_\infty = (\text{epi } f)_\infty$, which is called asymptotic function of f .

Definition of Asymptotic Functions

Definition 8

Let $f : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ be proper. Then, there exists $f_\infty : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ satisfying $\text{epi } f_\infty = (\text{epi } f)_\infty$, which is called asymptotic function of f .

How to create asymptotic function of f

To gain asymptotic function of f , we have 4 steps including providing the definition of f .

- ① provide f
- ② consider $\text{epi } f$
- ③ take $(\text{epi } f)_\infty$, the asymptotic cone of $(\text{epi } f)$
- ④ define f_∞

Properties around Asymptotic Functions

Proposition 9

Let $f : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ be a proper, lsc, convex function. Then, the asymptotic function is a lsc, proper, convex function, and one has

$$f_{\infty}(d) = \lim_{t \rightarrow +\infty} \frac{f(x + td) - f(x)}{t} = \sup_{t > 0} \frac{f(x + td) - f(x)}{t}, \forall x \in \text{dom } f$$

and

$$f_{\infty}(d) = \sup\{\langle x, d \rangle \mid x \in \text{dom } f^*\}.$$

Application of the notion of asymptotic function

Definition 10

Following Proposition 9, the asymptotic functions of the proper convex lsc function $\Phi : \mathbb{S}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ is defined by, for all $D \in \mathbb{S}^n$

$$\Phi_\infty(D) = \sup_{t>0} \frac{\Phi(A + tD) - \Phi(A)}{t}, \forall A \in \text{dom } \Phi \quad \text{and}$$

$$\Phi_\infty(D) = \sup\{\langle B, D \rangle \mid B \in \text{dom } \Phi^*\}.$$

Theorem 11 (A.Seeger (1997))

Let $f : \mathbb{R}^n \rightarrow \mathbb{R} \cup \{+\infty\}$ be a symmetric, lsc, proper, convex function with induced spectral function Φ_f . Then

$$(\Phi_f)_\infty = \Phi_{f_\infty}.$$

Conclusion

Summary:

- We figure out why a semidefinite programming with a penalty function like log barrier functions can be solved with using Fenchel duality.
- Asymptotic function can be applied to spectrally defined functions.

Issue:

- These consequences hardly appears in current studies because the way with using barrier function might not be utilized to obtain a optimal value.
- Actually, there is a relation between spectral functions and composite optimization models.
